

# A small economic research deck

An example to convert and check

2 October 2026

# A production function

Output depends on capital and labour:

$$Y = AK^{\alpha}L^{1-\alpha} \quad (1)$$

# A production function

Output depends on capital and labour:

$$Y = AK^{\alpha}L^{1-\alpha} \quad (1)$$

- For this example,  $A = 1$  and  $\alpha = 0.3$ .
- Equation (1) is an illustration, not an estimated relationship.

| Scenario    | Capital $K$ | Labour $L$ |
|-------------|-------------|------------|
| Baseline    | 100         | 50         |
| Alternative | 120         | 50         |

# Illustrative output

Source: invented teaching values; no empirical claim. See Workshop example [2026].

## Check the conversion

- ▶ Compare maths, figures, tables and slide order.
- ▶ Change one conversion rule; rerun and check again.
